1. Introduction

The project is a platform designed for teams working on projects. It supports three types of users: Workers, Project Managers, and Admins. Workers can view available tasks within their projects, select tasks to work on, and update the status of those tasks (in progress, completed). Project Managers can create projects, add tasks, assign workers to projects, and manage task distribution if needed. Admins are responsible for managing user accounts, assigning roles to users and deleting users if needed.

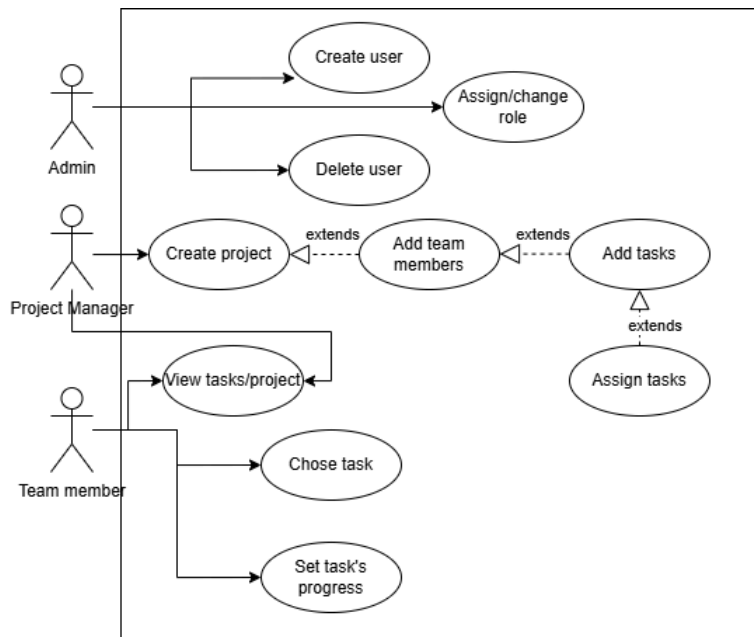

Not only the work environment use case, but the management of a school/university project fits this project. I always liked keeping things organized and enjoyed using such tools to keep track of progress and to distribute tasks equally.
